In this project we have no client, we have used postman to call rest APIs

There are 2 users one of them is admin the other one is user

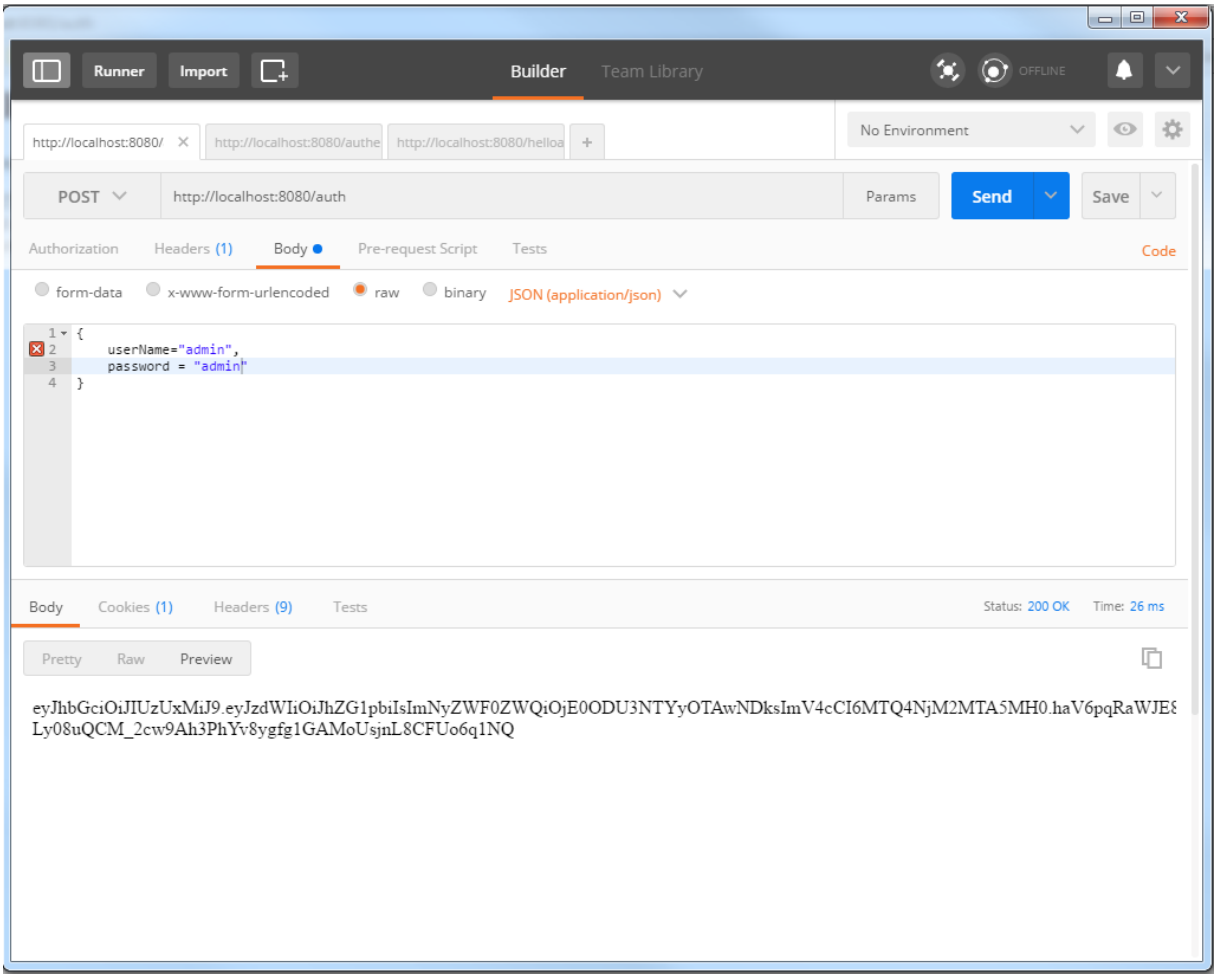
Username: admin

Password: admin

Username: user

Password: user

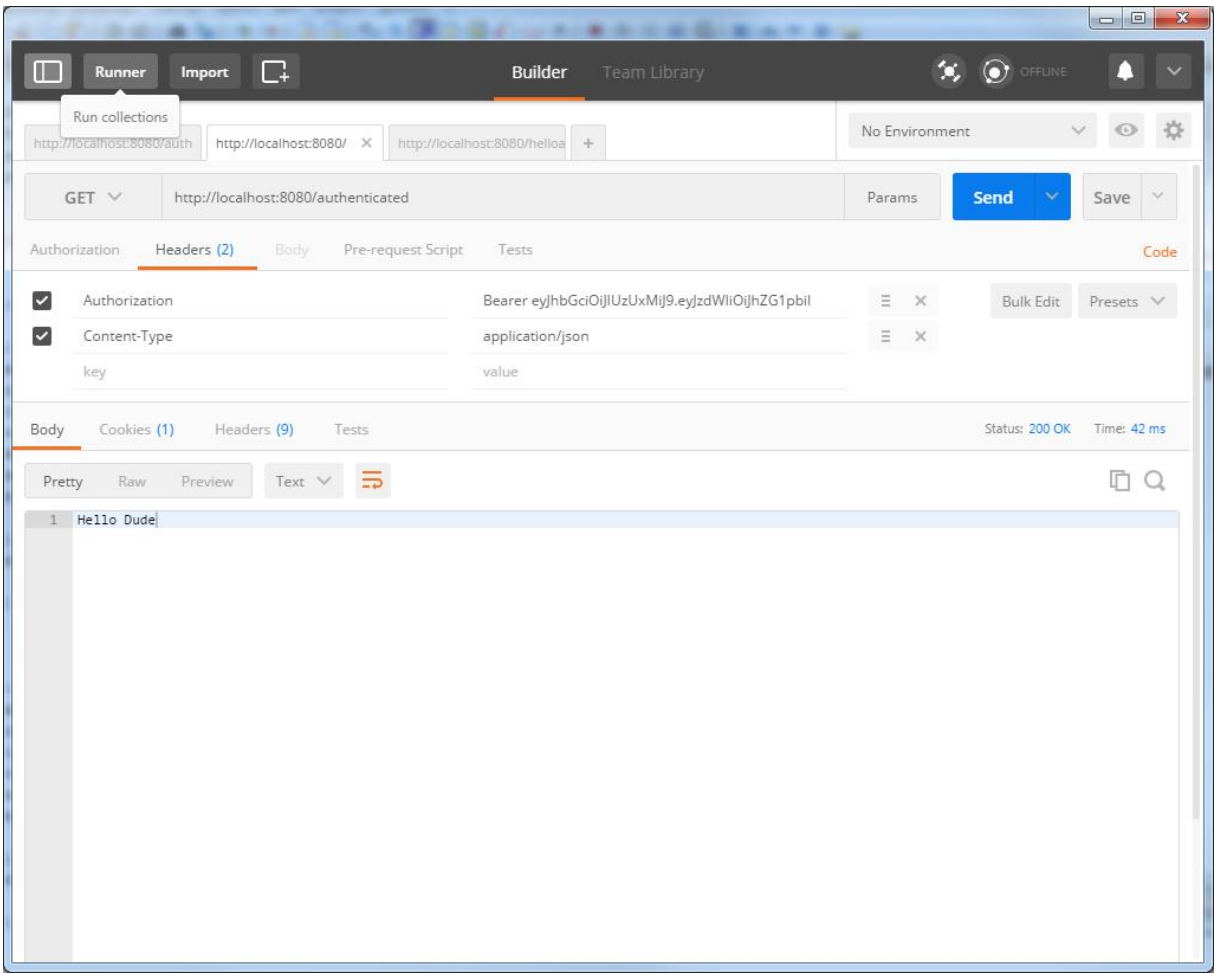
Call http://localhost:8080/auth from postman with “POST”



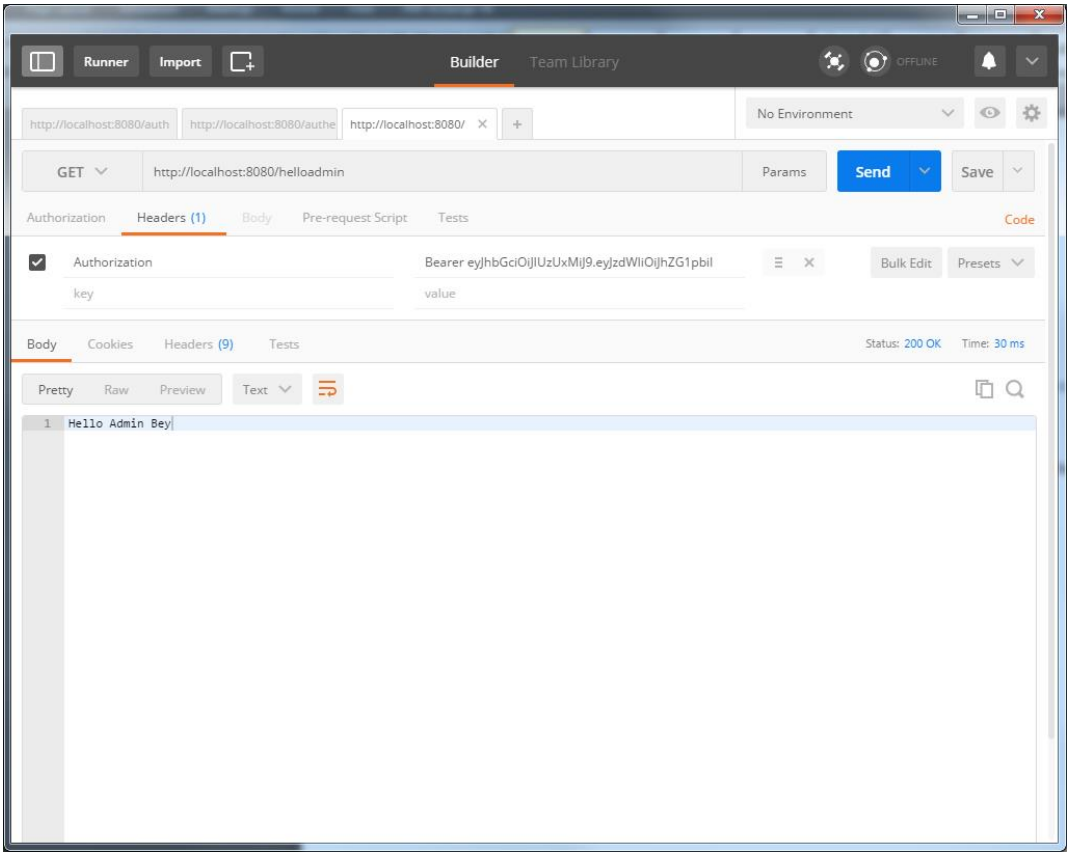
Our token is created and returned us. Copy it. We have authenticated, now we can call other APIs

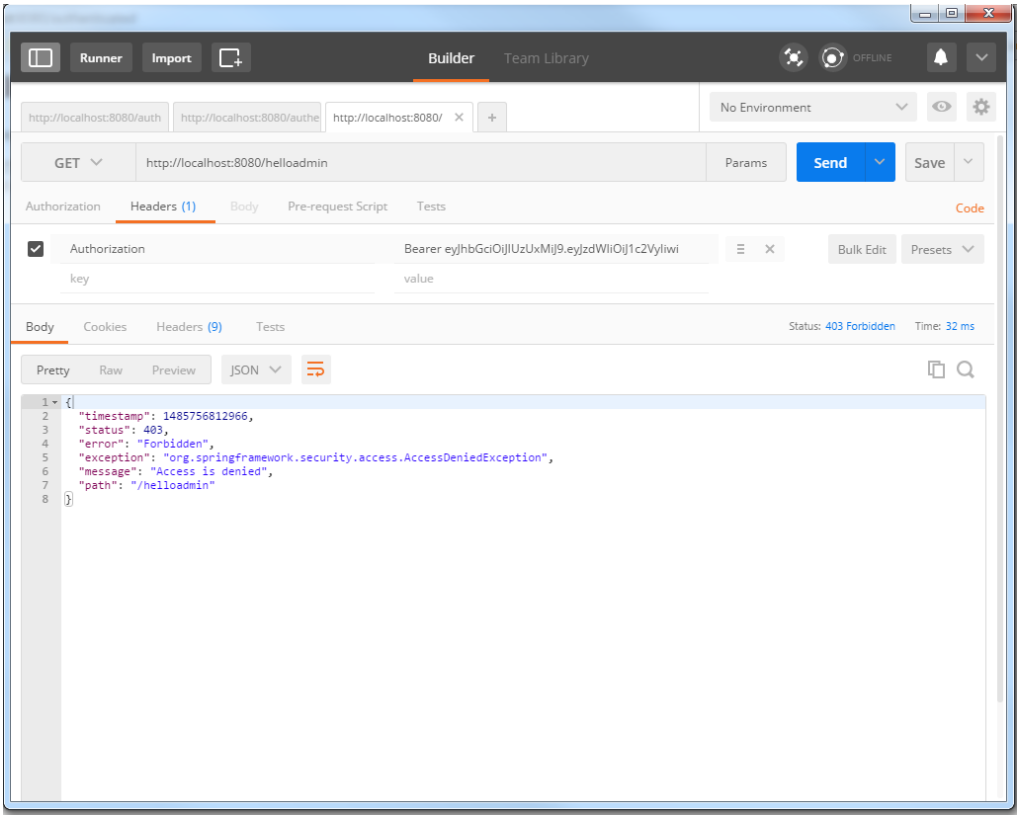
Paste already copied token to Authorization section, then call, http://localhost:8080/authenticated

Response will like following image.



We can secure our rest methods based role. So we have 2 rest methods. One of them is only can called by admins.





If we login with standart user, we wont be able to reach this method.
